What are assets?

Assets are things tracked via beacons as opposed to trackers. Beacons are much smaller than a tracker and require no external power. Example of items that you would want to use a beacon on are generators, ladders, toolboxes, etc.

Beacon uses Bluetooth to communicate with a tracker. A scenario where assets are best utilised is say you have multiple job sites and have vehicles that are tracked via trakngo. If an asset goes missing, you can use trakngo to look up which vehicle took that asset and to which job site.
